

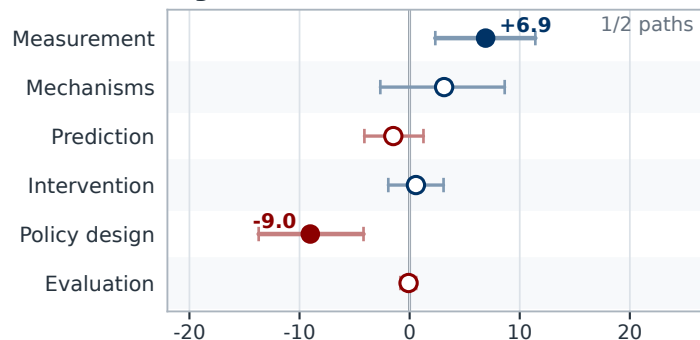

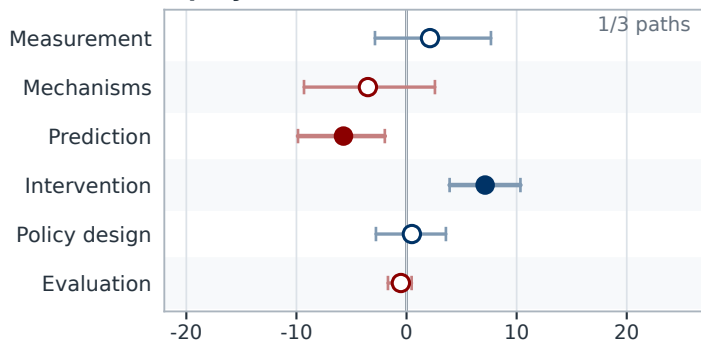

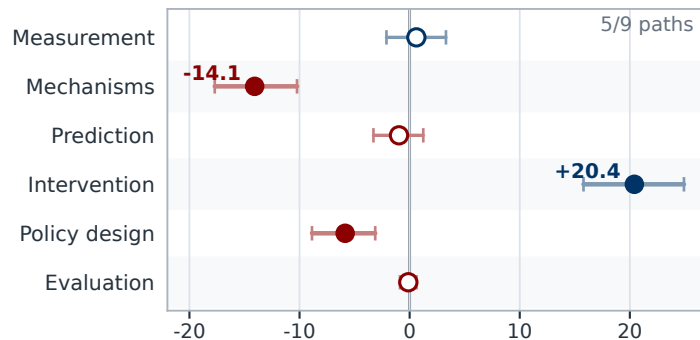

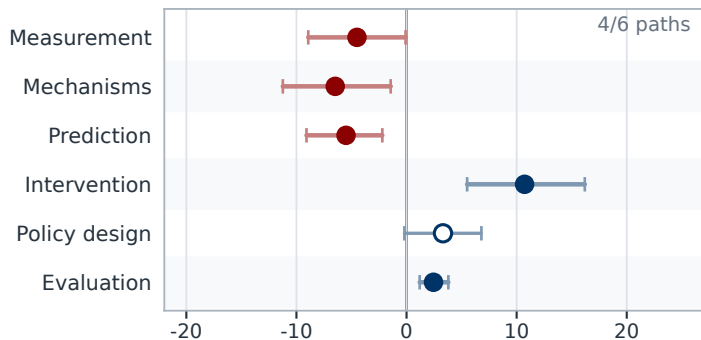

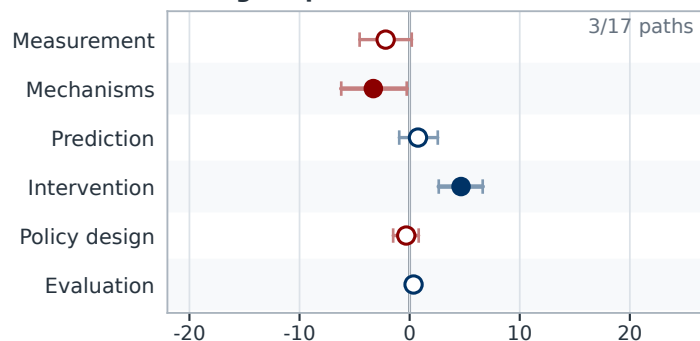

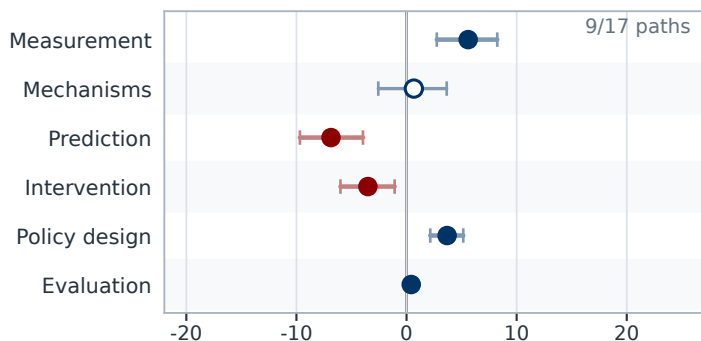

Fig. S6 **Domain-level differences in knowledge tasks**

Six urban-need domains · 36 domain-task estimates · bootstrap 95% intervals

NSFC higher

$$\leftarrow 0 \rightarrow$$

NSF higher

NSF – NSFC task-share difference (percentage points)

— NSF higher — NSFC higher — Open marker: interval crosses 0

State measurement and problem diagnosis

Intervention design and performance optimization

Mechanism analysis and causal identification

Planning decision support and policy design

Scenario simulation and risk prediction

Implementation monitoring and impact evaluation

Domain headers report paths with ≥ 1 task meeting path-level CI and BH-FDR criteria / eligible paths.

All 36 domain-task intervals are shown; path counts do not test domain-level significance.
